UK WORK ELIGIBILITY | UK GRADUATE ROUTE VISA | FULL RIGHT TO WORK UNTIL JAN 2028

SUMMARY

AI product-minded engineer with **2+ years** taking regulated-industry problems in insurance claims and fraud/AML from user need to deployed AI product. I start from the reviewer's job and the cost of a wrong decision, then design the trust features (cited evidence, abstain-to-human, audit trail) and the success metrics that let a regulated team adopt AI. Hands-on across the LLM, RAG and multi-agent stack, so I scope credibly, challenge estimates and make trade-offs between quality, cost and speed.

SKILLS

Product Management: Product discovery, problem framing, PRDs, user stories and acceptance criteria, product roadmap, KPI and metric trees with guardrails, evaluation plans, shadow-mode pilots, release planning, build-versus-buy and cost trade-offs, stakeholder management, client demos

Delivery and Methods: Agile/Scrum, SDLC, requirements gathering, BRD/FRD, process mapping (BPMN), gap analysis, workflow automation design, UAT, RACI

Product Tools: Jira, Confluence, ServiceNow, Microsoft Excel, PowerPoint, Power BI, Tableau, SQL, Langfuse

AI Product Knowledge: LLMs, RAG, AI agents, prompt engineering, guardrails and abstention, evaluation, observability, Responsible AI, NIST AI RMF, EU AI Act, ISO/IEC 42001

Technical: Python, FastAPI, REST APIs, JavaScript/TypeScript, LangChain, LangGraph, CrewAI, MCP, PostgreSQL, pgvector, FAISS, Docker, Git, GCP (Cloud Run, GKE), Vertex AI

EDUCATION

MSc Applied Artificial Intelligence and Data Analytics (First Class)
University of Bradford, UK — *Sept 2024 - Sept 2025*

BE. Electronics and Telecommunications (Distinction) GPA-7.76
AISSMS Institute of Information and Technology — *Jan 2021 - June 2024*

EXPERIENCE

AI Product Manager | Gamaka Intellectual Machines — *Oct 2024 - Present*

- Worked with medical advisors and claim reviewers to turn clinical and compliance rules into testable product requirements for a medical insurance claims platform, writing user stories with acceptance criteria in Jira and keeping documentation and decisions in Confluence.
- Helped define what the claims system decides on its own and what goes to a medical officer, balancing automation against the cost of a wrong decision, and turned reviewer workflows into features such as evidence shown beside every finding with approve, query or deny actions.
- Shaped a fraud and AML triage product around tiered ML-before-LLM processing and a two-call cap per alert, which keeps AI cost, latency and audit behaviour predictable for compliance teams.
- Defined how quality is judged, using a fixed evaluation set, groundedness checks and override rate alongside speed metrics, tracked with Langfuse and pytest, and reported status, KPIs and risks to stakeholders through Jira, Confluence and Power BI, with incidents and change approvals followed in ServiceNow.
- Built RAG pipelines (LangChain, Langflow), OpenAI API interfaces and multi-agent workflows (CrewAI, MCP, LangGraph) grounded in proprietary data, and shipped them on GCP.

CERTIFICATIONS

- Oracle Cloud Infrastructure Gen AI Professional
- Kaggle Python Coder
- AI & Agile (Scrum Alliance)

ACHIEVEMENTS

- Open-source contributor to ElizaOS DeFi Oracle Agent plugin for Nosana x ElizaOS Challenge
- Student Representative at University of Bradford
- Top rank in Excellidia's AI Leadership program (50+ participants)

KEY PROJECTS

Medical Insurance Claim Validation Engine | Python, LangGraph, Streamlit, ServiceNow

Gamaka Intellectual Machines

- Framed the product problem with medical advisors and claim reviewers: manual claim validation was slow, inconsistent and hard to audit. Gathered requirements through interviews and written rules, then wrote them as user stories with acceptance criteria in Jira, linked to their source requirement.
- Made trust the core product decision: no finding is accepted without a verbatim quote from the source documents, and anything without one returns ABSTAIN to a medical officer with the evidence attached, so automation covers clear cases and people keep control of risky ones.
- Delivered the platform on GCP (Cloud Run for APIs, GKE for workers) in Agile iterations, with a validation pipeline where ICD-10 coding by hybrid retrieval (BM25, embeddings, Reciprocal Rank Fusion) feeds six parallel validation agents (LangGraph) with typed outputs (Pydantic v2).
- Designed the reviewer experience in a Streamlit dashboard that shows the evidence next to each finding and offers approve, query or deny, with an audit trail of every decision.
- Defined the success metrics and quality guardrails: auto-validation share, ABSTAIN rate, override rate, minutes per claim, LLM cost per claim and groundedness, tracked through Langfuse traces and a pytest evaluation suite so speed is always read next to quality.
- Documented requirements, the decision log and architecture in Confluence, linked to Jira tickets, and handled production incidents and change approvals through ServiceNow.
- Set up governance with a version-controlled clinical knowledge base, medical-advisor review and bitemporal PostgreSQL history, so any past decision can be reconstructed as the engine saw it on that date.

Agentic AI System for Fraud & AML Risk Triage | Python, Confluence, JIRA

Gamaka Intellectual Machines

- Framed the product problem as alert fatigue: analysts spend most of their time on low-risk alerts, and SARs must be defensible to regulators. Wrote the requirements and success criteria that the design was built around.
- Chose a tiered product approach in which scikit-learn anomaly-detection and NetworkX graph models pre-screen alerts, so only high-risk alerts reach the LangGraph LLM pipeline and most never need an LLM.
- Shipped SAR drafting grounded by hybrid RAG (FAISS), where every factual claim is cited to a source text span and independently verified by a second LLM before an analyst sees it.
- Set a cost and latency ceiling by design, with at most two LLM calls per escalated alert, which keeps spend predictable and audit behaviour consistent across the ML and LLM tiers.
- Defined the KPIs for the product, including precision and recall of the ML tier, share of alerts cleared before the LLM, groundedness of SAR claims and analyst edit rate, and presented them in a Power BI view.
- Broke the 10 agent specifications into epics and stories in Jira, with acceptance criteria for each agent’s controls and outputs.
- Documented the 21-page specification, four diagrams, controls, provenance and evaluation plan in Confluence, linked to the Jira work, and deployed the system as independent containerised services on GKE.
